Pentest-tools review. Top 10 pentesting tools. Best free pentest tools. Most common pentesting tools. Pentest tools for android.

Automation testing tools are applications designed to verify function and/or non-functional requirements via automated test scripts. With the Agile and DevOps manifesto as the standard of software testing, setting a clear-cut automation testing tools evaluation strategy is key. Ultimately, this strategy will need to answer the questions of: What features are you looking for? Who's going to use the tool for testing? Devs or QA people? Can it be integrated with CI/CD pipelines or toolchains? Is it easy to maintain scripts and reuse test assets? What is your team's budget? Where can you get support for technical issues? Plus, there isn't really a one-size-fits-all automation tool. It really boils down to your team's specific needs. Top 15 List of Automation Testing Tools (with Feature Highlights) Comparison Automation Tools Katalon Studio Katalon Studio is a low-code and scalable automation testing tool for web, API, desktop (Windows), and mobile applications. Up until now, the Katalon community has surpassed the 1 million users and it has been the trusted automation solution of over 100,000 businesses. Having removed the requirements of coding and building a test automation framework from square one, users can just download the tool and focus solely on testing. Additionally, Studio offers frequent releases to stay compatible with the latest platforms/browsers/OS. Feature Highlights: Flexible methods for test design: Record & Playback, Manual and Scripting Mode Supported testing methodologies: BDD, DDT, Keyword-Driven Testing, Cross-Browser Testing (Headless, Chrome, Edge, Firefox and Safari) and Cross-Platform Mobile Testing (iOS, Android) Automatic Retry Failed Tests, Smart Wait, and Self-Healing mechanisms Reusable test objects, keywords, and test cases with Test Artifact Sharing and Page Object Model design Native integrations with popular CI/CD and ALMs tools (Jira, GitLab, Jenkins, BitBucket, Azure DevOps, etc.) Smart Debugging UI and test reporting to troubleshoot failures quickly Detailed tool documentation and video tutorials on Katalon Academy Website: Free or \$76/month Selenium Selenium Rolled out in 2004, Selenium is one of the most, if not the most, popular open-source framework for web testing automation. Its suite of software consists of Selenium WebDriver, Selenium Grid and Selenium IDE. Feature Highlights: Supported programming language: Java, C#, Python, JavaScript, Ruby, PHP, etc. Supported browsers: Chrome, Firefox, IE, Microsoft Edge, Opera, Safari, etc. Testing on local or on remote machines via the Selenium server Parallel and cross-browser executions to reduce execution time and increase test coverage Integrations with other testing frameworks (like TestNG for reporting) and CI/CD tools Website: Free Appium Appium Like Selenium, Appium is also an open-source automation testing tool, but for mobile applications. Using mobile JSON wire protocol, Appium allows users to write automated UI tests for native, web-based, and hybrid mobile applications on both Android and iOS. Feature Highlights: Supported programming languages: Java, C#, Python, JavaScript, Ruby, PHP, etc. Supported browsers: Chrome, Firefox, IE, Microsoft Edge, Opera, Safari, etc. Testing on local or on remote machines via the Selenium server Parallel and cross-browser executions to reduce execution time and increase test coverage Integrations with other testing frameworks and CI/CD tools Website: From \$2,890/year Perfecto Perfecto is a cloud-based and automated testing platform for web and mobile applications. Features: Automated cross-environment executions, custom capabilities, test analysis, and broad integrations. Perfecto makes continuous testing more achievable for DevOps teams. Feature Highlights: Scriptless test creation for UI web applications Real-user stimulation for mobile testing, network visualization, and other real-world conditions Parallel execution across platforms Advanced test prioritization and reporting. Feature Highlights: Online Selenium Grid on the cloud of over 2000 devices, browsers, and OSs Support for Cypress for end-to-end parallel and cross-browser executions Geolocation web testing across over 27 countries Integrations with other testing frameworks and CI/CD tools Website: From \$939/month Postman Postman is one of the most widely-used automation testing tools for API. It allows users to write different kinds of tests, from functional integration to regression tests, and execute them automatically in CI/CD pipelines via the command line. Feature Highlights: Friendly and easy-to-use interface equipped with code snippets Support for multiple HTTP methods: Swagger and RAML formats Broad support for API schemas to generate collections and API elements Test suite creation, executions with parameterization, and debugging Integrations with popular CI/CD tools Website: Free or from \$12/user/month SoapUI SoapUI This open-source API testing tool is designed for REST and SOAP Web Services. Some vital features include automated functionality, performance, regression, and security testing. Users can also aim for the commercial version – ReadyAPI (formerly SoapUI Pro) for more advanced capabilities. Feature Highlights: Drag and Drop to create tests, even with complex scenarios Service stimulation to reduce efforts of building production systems for testing Quick and easy test script reusability More protocol support, capabilities, and CI/CD integration with ReadyAPI Website: Free or from \$749/year for ReadyAPI Eggplant Functional Eggplant Functional Being a part of Eggplant's ecosystem, Eggplant Functional is a GUI automation testing tool for mobile, desktop, and web applications. With an image-based approach, it allows a single script to automate different combinations of platforms and technologies. Feature Highlights: Flexible methods for test design, recording, manual mode, and assisted scripting Unique English-like scripting language – SenseTalk Connection to Eggplant ecosystem for more testing capabilities and monitoring Integrations with popular CI/CD tools Website: Contact sales Tricentis Tosca Tricentis Tosca is a comprehensive automation tool for web, API, mobile, and desktop testing. It has a unique model-based testing approach, allowing users to scan an application's UI or APIs to create a business-familiar model for test creation and maintenance. Feature Highlights: Codeless test creation and high reusability of test assets with the model-based approach Risk-based test optimization with smart test design and requirement prioritization Service virtualization to stimulate and build realistic testing environments API web services and analyze the AUT's performance. Jmeter can also be used for functional API testing. Feature Highlights: Friendly and easy-to-use interface Test plan creation with recording feature Test execution in both GUI and CLI modes Support for many different testing servers, primarily for web applications. Built-in a keyword-driven approach, it's low-code and also extendible with a rich ecosystem of tools and libraries. Feature Highlights: Case creation with easy tabular syntax Keyword-driven and data-driven testing Variants for testing in different environments Support for plenty of external libraries and integrations with other tools Website: Free Protractor Protractor This open-source framework automates end-to-end testing primarily for Angular and AngularJS applications. It works as an integrator of Selenium, WebDriver, Jasmine, Node.js, and other technologies. That said, Protractor can also work well for regression testing with non-Angular apps. Feature Highlights: Test execution in a real browser using native events Element identification Angular applications with extended HTML attributes Support for behavior-driven development frameworks like Jasmine and Mocha Automatic waiting Parallel and cross-browser testing with Selenium Grid Website: Free Select Your Best Fit Automation Testing Tool There's no need to emphasize again the importance of automation testing tools. To pick one for your team, don't just blindly follow other teams' success. Instead, look at your team's specific needs, human resources, and future scalability, to choose the best fit option. If your team's testers are experienced developers, using Selenium or Appium for an automation framework can be great since it allows you to build and scale from the ground up. However, if your team consists of mostly manual testers and you need a low-code solution to start but it can also grow with the team's future scalability, ready-made frameworks like Katalon Studio can be a perfect solution. Creating, running, maintaining tests and getting centralized analytics of test results can be done effortlessly.
